TECHNICAL ABSTRACT	
<p>In the dynamic world of SMEs, business owners navigate through the day with a pragmatic approach, juggling various technological tools to steer their ventures towards success. However, despite their adaptability and resourcefulness, a significant challenge remains: the complexity of managing disparate systems. From POS software to Access Control and Time Attendance systems designed by security experts, these tools are indispensable yet operate in isolation. This fragmented technological landscape complicates the seamless operation of businesses.</p> <p>Recognizing this critical gap, our proposal seeks to pioneer a transformative solution that harmonizes these vital business operations into a single, integrated platform. By integrating business software with the Access Control/Time Attendance terminals from HIKVISION, we envision a unified ecosystem that empowers small business owners with the efficiency and simplicity of managing their operations through a single interface. This innovative integration promises not only to streamline business processes but also to enhance operational visibility and control, enabling owners to focus more on other areas of their business.</p> <p>With the support of the MRIC, this project stands to redefine the technological landscape for SMEs, offering them simplicity and integration in an increasingly complex digital world.</p>	
Key Words: SMEs, POS software, mini-ERP, Access Control/Time Attendance
